Block Designation Markers

MAR-MED introduces a simple means for marking histology blocks. The system consists of uniquely shaped multi-colored pellets that are added to the cassette when embedding. When the cassette is cooled the colored pellet is easily recognized by the histologist. The pellets are available in 23 colors and are easily dispensed from its container. The pellets can be used in numerous ways. Each technician can be designated to a particular color pellet so that if questions arise on a particular cassette, that technician can be contacted. This is particularly helpful if part time help is used by the laboratory. Different types of tissue use two different colored pellets in the cassette, one color to designate the technician and one for tissue identification.

Unlike the current way of using colored cassettes or colored ink pens to identify cassettes, the MAR-MED BLOCK MARKER SYSTEM allows greater flexibility and longer lasting markers. The colored pellets will not fade or wipe off when handled by the employee. They are embedded in the wax.

The Pathologist can also use these pellets to designate to the technician his special instructions, by simply dropping a colored pellet in the cassette before it is embedded.

The MAR-MED BLOCK MARKER SYSTEM pellets are solvent resistant, fade resistant and economical.
